

## Experiment No. 3

**Aim:** To Perform various GIT operations on local and Remote repositories using GIT Cheat Sheet

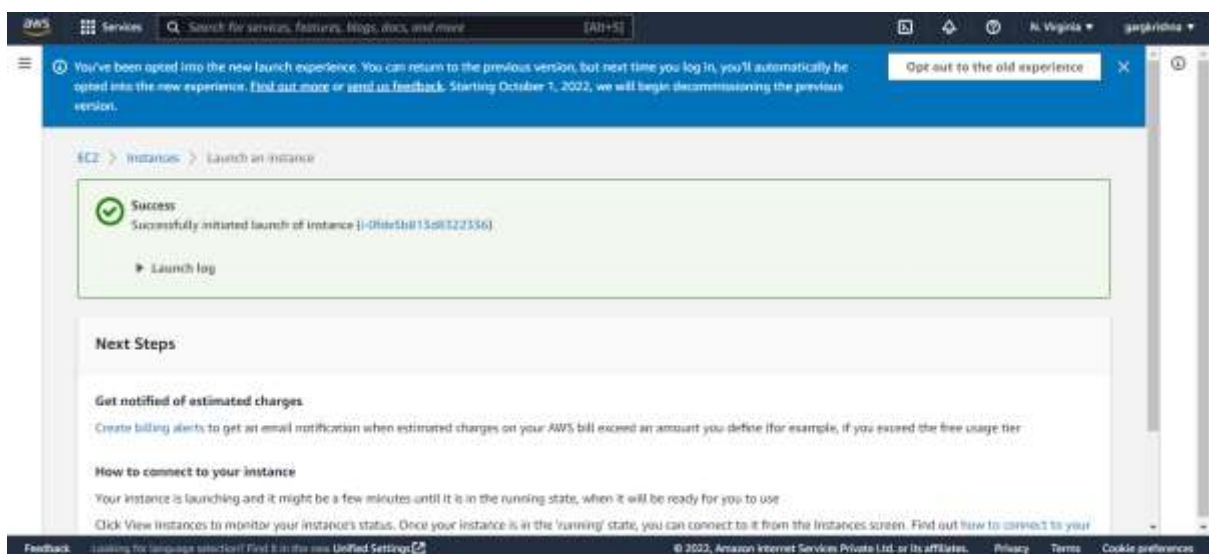

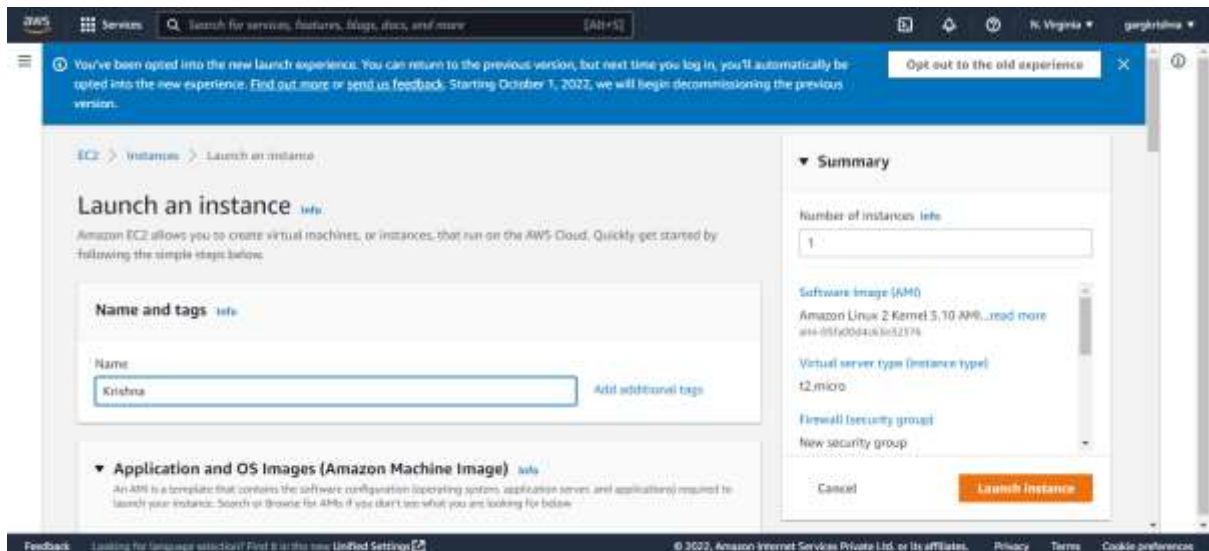

**LO No. & Statement:** (LO2): To obtain complete knowledge of the “version control system” to effectively track changes augmented with Git and GitHub

**Theory:**

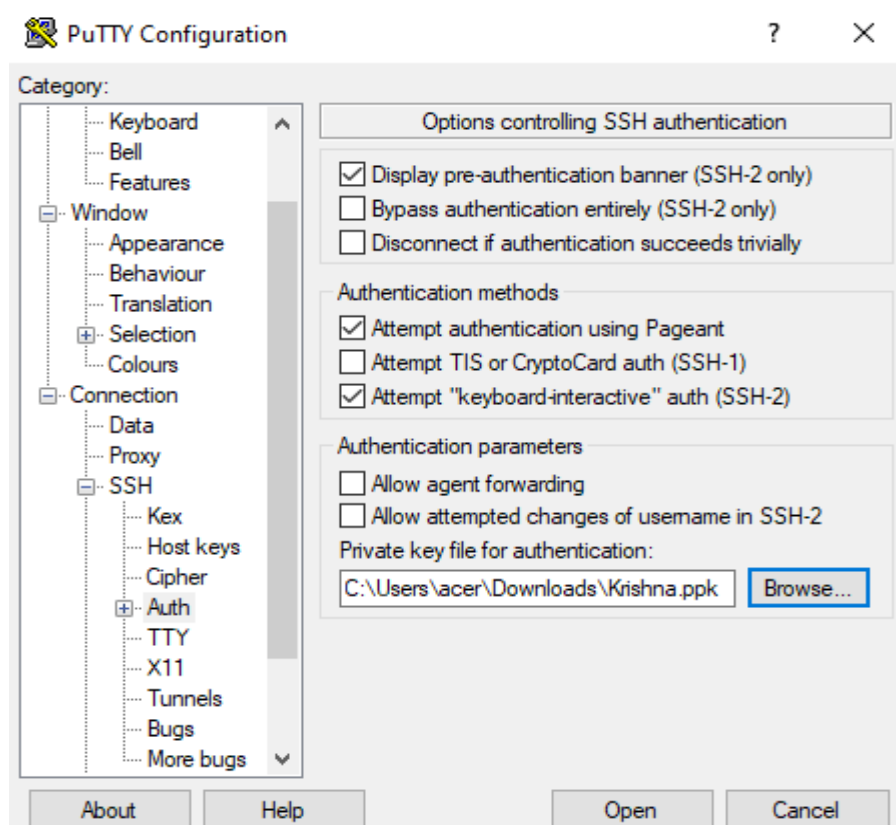

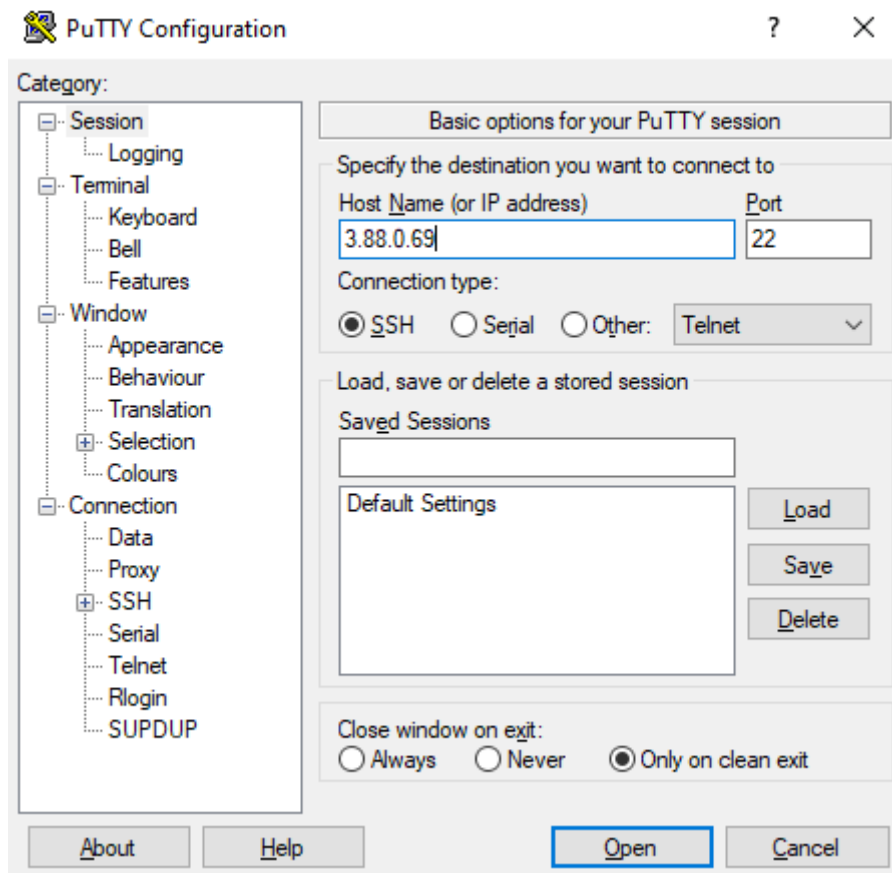

**Remote:** For Push

**Steps:**

- Create the Instance on AWS under N. Virginia Region
- For creating the Instance first Sign Up for your AWS account.
- Then go to Console and click on EC2. There you will see Instance click on it and create the instance, while making the instance select create new key pair and choose .ppk extension for new key pair and download that key pair.

Download the PuTTY App and open it and login as ec2-user with the IP address and. ppk key.

- Apply all the updates
  - sudo su
  - yum update -y
- Install Git
  - yum install git -y
- Check the version of Git
  - git -v
- Add the user name and email address and list it
  - git config --global user.name "Name"
  - git config --global user.email "Email"
  - git config --list
- Make a new directory and create one file and add some text to that file
  - mkdir 19
  - ls
  - cd 19
  - cat >>Krishna
- Initialize git
  - git init
  - git status
- Push the repository to GitHub
  - git add .
  - git commit -m "first commit"
  - git status
  - git log
  - git show (paste the yellow no. copied from the last command)
  - git remote add origin (paste the URL of the repository)
  - git push -u origin master

```

For Pull

Create the one more Instance on AWS under Ohio Region

With PuTTY App login as ec2-user with the IP address and .ppk key

Follow the same steps to update, download git add global user and email

- Make a new directory
  - mkdir pull
  - cd pull
- Initialize Git
  - git init
- Pull the repository from GitHub
  - git remote add origin (paste the URL of the repository)
  - git pull origin master
- Edit the File
  - ls
  - cat >> filename
- Push the repository to GitHub
  - git add .
  - git commit -m "first commit"
  - git status
  - git log
  - git show (paste the yellow no. copied from the last command)
  - git remote add origin (paste the URL of the repository)
  - git push -u origin master

## Local: For Push

### Steps:

- Download and install Git on to your system
- Run the Git and move to the folder you have created from this project with cd command
- Initialize Git
  - git init
- Add the username and email address
  - git config - -global user.name "Name"
  - git config - -global user.email "email@example.com"
- Create one file and add some text
  - cat >> Krishna19
- check the status
  - git status
- Push the file into the repository in GitHub
  - git add .
  - git commit -m "first commit"
  - git status
  - git log
  - git remote add origin (paste the URL of the repository)
  - git push -u origin master

```

## Conclusion:

From this experiment, I have learned and understood how to push and pull file using GIT Cheat-Sheet and do it on the local machine as well as on remote using AWS EC2 Instance. Also was able to get knowledge of the version control system to effectively track changes augmented with Git and GitHub.

We have achieved LO2 from this experiment.

We have also achieved Program Outcomes PO1, PO2, PO3, PO4, PO5, PO12.
